About this report

This Local Government Area (LGA) Liveability Scorecard has been prepared by the Australian Urban Observatory (AUO) in partnership with the Health Promotion Unit, Sydney Local Health District. It has been designed to understand the liveability of individual suburbs within an LGA and prioritise future actions and investments of interest to councils, community, urban planners, developers, and other decision makers to achieve healthier and more liveable places across an entire LGA.

The LGA Liveability Scorecard includes AUO indicators measuring overall liveability, walkability, social infrastructure, public transport, healthy food, alcohol, public open space, local employment and housing affordability [1]. For each indicator, suburb level results are compared to the LGA average to understand place-based liveability strengths and areas needing future prioritisation and action. All AUO indicators align with the UN Sustainable Development Goals [2].

The LGA Liveability Scorecards are aligned with a range of AUO scorecards including City Scorecards and Growth Area Scorecards developed by the AUO @ RMIT University based on 2021 indicator results.

More detailed neighbourhood, suburb, and Local Government Area results across Australian cities are available online at auo.org.au.

Summary for Canada Bay

Indicator		Brief Description	Value		nce between LGA and er Sydney
Liveability Index	▽	Liveability Index	101.2	•	Similar*
Walkability Index	Å	Walkability Index	1.3	A	Better
Social Infrastructure Index		Social Infrastructure Index	6.9	•	Similar*
Public Transport	Image: Control of the	Percentage living within 400m to regular public transport	82.8%	A	Better
Food Environment	Ŏ	Average distance to closest healthy food outlet (super- market or greengrocer)	728.5m	A	Better
Alcohol Environment	O Y	Average distance to closest off-license alcohol outlet	500.8m	•	Worse
Public Open Space		Percentage living within 400m of public open space of 1.5 hectares	65.5%	A	Better
Local Employment		Percentage of employed peo- ple living and working in the same SA3	21.6%	•	Worse
Housing Affordability		Percentage of households spending more than 30% of income on housing costs	37.7%	•	Similar*

^{*} Similar = less than 10% difference between LGA and city average.

Liveability Index

Rationale

The economic, social, environmental and health co-benefits of urban liveability are recognised by all levels of government in Australia and globally [3]. Liveable communities are safe, socially cohesive, inclusive and environmentally sustainable [4]. They have affordable housing linked via public transport, walking and cycling infrastructure to employment, education, shops, services, public open space and social, cultural and recreational opportunities [3].

What we measured

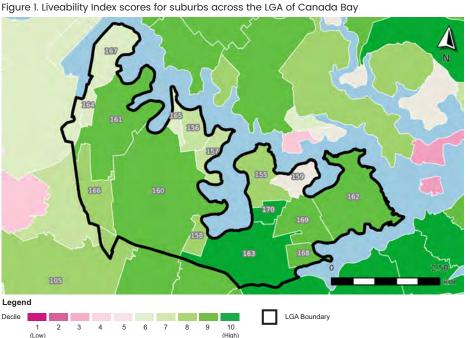

The Liveability Index is underpinned by over a decade of research. It combines six domains of liveability found to be associated with health and wellbeing outcomes: walkability; access to social infrastructure; public transport; larger public open space; affordable housing; and local employment.

Results

ID	Suburb	Value
163	Five Dock	103.9
170	Wareemba	103.5

164	Liberty Grove	99.1
165	Mortlake	99.0
167	Rhodes	98.9
159	Chiswick	97.6

The Liveability Index score for residences across the LGA of Canada Bay is

This Liveability Index score is similar to the Greater Sydney average of 99.7.

Rationale

Walkability measures the ease and safety of walking in an area. Neighbourhoods that have shops and services to walk to, small blocks, good street connectivity, and higher population density are more walkable [5] Walkable neighbourhoods discourage driving and encourage active travel resulting in higher levels of walking and cycling. The benefits of a physically active life are well established in reducing chronic disease and maintaining health and wellbeing $^{[6]}$.

What we measured

Walkability for Transport is calculated as a composite index, with 0 being the national average, that includes access to daily living destinations (something to walk to), dwelling density (population needed to supply services and destinations), and street connectivity (a way to get there) within a reasonable walking distance of home. The higher the score above zero, the more walkable the area.

Social Infrastructure

Rationale

Social infrastructure refers to essential community services and resources $^{[7]}$. Ready access to a wide range of different types of social infrastructure is important for the creation and ongoing development of healthy communities. The availability of well-planned social infrastructure supports liveable communities by promoting increased physical activity $^{[8]}$, wellbeing $^{[7]}$, increased satisfaction with the local community $^{[9]}$, improving social interactions and mental health outcomes $^{[10]}$. Social infrastructure is a key component of liveability.

What we measured

The Social Infrastructure Index includes access to 16 types of social infrastructure at various recommended distances from dwellings. It includes access to childcare facilities, community centres, libraries, aged care facilities, pharmacies, family and community healthcare, dentists and general practitioners, sporting facilities, swimming pools, outside school hours childcare, primary and secondary schools, museums or galleries, and cinemas and theatres.

Public Transport

Rationale

People living close to public transport are more likely to use it, less dependent on cars and more likely to achieve physical activity requirements ^[6]. Living within 400m of a public transport stop with a service every 30 minutes encourages more walking ^[11]. It supports sustainability and people with restricted mobility, including young people, older adults, people with disabilities and people who don't own cars to access services, education and jobs.

What we measured

We measured access to bus, train, and tram stops with an average service interval of no more than 30 minutes between the weekday hours of 7 am and 7 pm. Access was measured as the percentage of dwellings with a regular service within 400m of any of these stops based on a walkable road network distance.

V

The percentage of households across the LGA of Canada Bay with access to frequent public transport is

82.8%

This is better than the Greater Sydney average of 73.3%.

Figure 4. Access to Frequent Public Transport within 400m across the suburbs of the LGA of Canada Bay

2025 CC BY- NC- ND 4.0

Date: Australian Bureau of Statistics (ABS), 2021 under CC by 4.0; OpenStreetMap, 2021 under ODbL; Australian Children's Education & Care Quality Authority, 2021; Australian Curriculum, Assessment and Reporting Authority, 2021; Healthdirect Australia National Health Services Directory, 2021, via AURIN Portal, 2021. Map tiles: CartoDB, under CC BY 3.0, featuring data by OpenStreetMap, under ODbL.

Rationale

Supermarkets support healthy eating and provide access to affordable fresh fruit and vegetables. People living within a short walk of a supermarket are more likely to walk or cycle instead of driving [6,12]. Increases in physical activity through active transport modes like walking and cycling, also reduce chronic disease risk and traffic congestion. In disadvantaged areas, living within 800m of a supermarket reduces the risk of overweight and obesity $^{\left[13\right] }.$

What we measured

We measured the average distance to a healthy food outlet (supermarket or greengrocer). Distances were calculated according to a pedestrian accessible road network.

Results

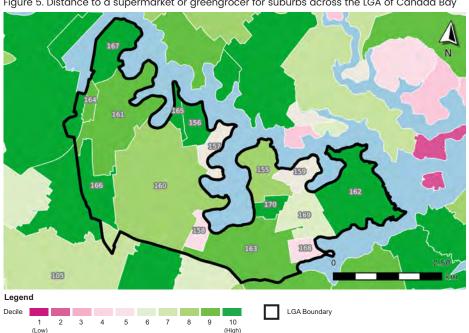

ID	Suburb	Value
166	North Strath- field	309.8m
165	Mortlake	319.7m

157	Cabarita	1369.9m
168	Rodd Point	1420.3m
158	Canada Bay	1570.7m

The average distance to a supermarket or greengrocer for residences in the Canada

728.5 metres.

This is better than the Greater Sydney average of 1117.9 metres.

Dato: Australian Bureau of Statistics (ABS), 2021 under CC by 4.0; OpenStreetMap, 2021 under ODbL; Australian Children's Education & Care Quality Authority, 2021; Australian Curriculum, Assessment and Reporting Authority, 2021; Healthdirect Australia National Health Services Directory, 2021, via AURIN Portal, 2021. Map tiles: CartoDB, under CC BY 3.0, featuring data by OpenStreetMap, under ODbL.

Alcohol

Rationale

Increased access to alcohol has been linked to harmful alcohol consumption and alcohol-related violence $^{[14,16]}$. Furthermore, alcohol outlets are more likely to be located in more disadvantaged areas $^{[16]}$. For those living in disadvantaged areas where there are fewer alcohol outlets, there appears to be a protective affect with enhanced self–reported health $^{[16]}$.

What we measured

The average distance to off-license alcohol outlets which includes bottle shops and supermarkets where alcohol can be purchased and taken to another premise for consumption. Distances were calculated from individual dwellings using a pedestrian accessible road network.

The average distance to an off-license alcohol outlet across the suburbs of the LGA of Canada Bay is

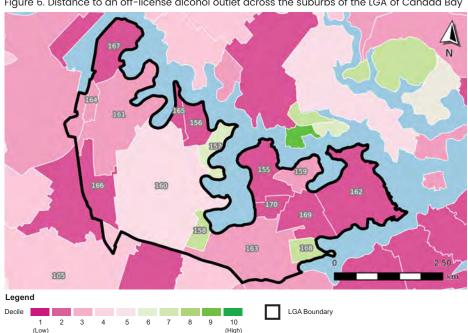

500.8 metres.

This is worse than the Greater Sydney average of $799.3\,$ metres.

Map tiles: CartoDB, under CC BY 3.0, featuring data by OpenStreetMap, under ODbL.

Public Open Space

Rationale

Public open space includes parks, open areas and places where people can congregate for active and passive recreation and enjoyment. Parks are one form of public open space that usually include grassed areas, gardens, and some green recreational space. Public open spaces support both the physical and mental health of people living nearby. Green public open spaces also support ecosystems, ecology and biodiversity of an area [17] and provide cooling effects mitigating urban heat island effects.

What we measured

Large Public Open Space was defined as urban parks greater than or equal to 1.5 hectares, since larger parks have been shown to support physical activity. Access was measured as the percentage of dwellings within 400m based on a walkable road network distance.

Results

Map tiles: CartoDB, under CC BY 3.0, featuring data by OpenStreetMap, under ODbL.

Employment

Rationale

Accessible employment is a social determinant of health, providing people with financial resources to support themselves and their families. Access to local employment reduces vehicle kilometres travelled, travel time and traffic congestion on city roads. It also increases the likelihood of people using active transport such as walking, cycling and public transport, and has been associated with improved self-reported health [18]. Access to local employment with shorter travel times has the potential to support work-life balance and is associated with a reduced risk of obesity [19].

What we measured

We measured access to local employment as the percentage of residents living in an Australian Bureau of Statistics' Statistical Area Level 1 (SA1), and working within the same Statistical Area Level 3 (SA3). On average, SA1 areas represent approximately 400 people while SA3 areas represent between 30,000 and 130,000 people.

Map tiles: CartoDB, under CC BY 3.0, featuring data by OpenStreetMap, under ODbL.

Housing

Rationale

Housing is a key social determinant of health. Decent and affordable housing supports families by providing safe, stable, and healthy shelter. Affordable housing frees up family finances for use on healthcare and food, and supports physical and mental health and wellbeing. Housing affordability stress is associated with poorer self-reported health, higher community dissatisfaction, and residents feeling unsafe. Affordable housing frees up family finances for use on health care, food, education and recreation, and supports physical and mental health and wellbeing [20].

What we measured

Housing affordability was measured according to housing stress and represents any household spending more than 30% of their household income on housing costs.

Results
